

OIL GUN WITH SCHRADER FITTING

The addition of oil to a REXA assembly is accomplished through the pneumatic style “Schrader” fitting provided on the power module. This fitting connects to the expansion reservoir which is part of the low pressure portion of the hydraulic circuit.

Since the oil is added to the low pressure circuit a standard manual grease gun can be adapted with a mating connector, which can be found at most automotive parts stores.

REXA offers kit number **S03082** that includes a gun fully adapted for this purpose. It includes all fittings and a 12-inch hose to simplify the filling of units in difficult mounting positions.

Please refer to the proper installation manual for oil recommendations and fill levels prior to performing any maintenance on your equipment.
